

What is the current situation?

Our project is mostly done now with almost all of the user stories done that we had intended to complete before the end of the course. We only have some java documentation left.

What do you want the situation to be?

Complete javaDoc for methods and classes should be enough

Reduce the gap (A->B)

write the documentation

### Customer Value and Scope

- We have more or less achieved what we set out to do at the beginning of the course; an app that displays markers for free parking, with search functionality
- There were no additional stories planned for this week, since most of the work consisted of cleanup after merging a large update to our main branch

### Application of Scrum

- the roles you have used within the team and their impact on your work

Every member of the team was assigned a specific role to work on this week. We included things like writing our javadoc and also working with the report when making these assignments. By doing this everyone had a clear idea on what they should do and we have done this in all sprints because it really structures everything up for us since we know who is working with what.

- the agile practices you have used and their impact on your work

This sprint most of the work was done as a full group trying to get the final merge to work during full-team meetings as such agile methods have not been as applicable this week.

-We do our work within the groups and try to achieve our user stories and also double check with everyone before submitting our code. This week we haven't really used this that much but we still used agile practices when writing our final report and also

when we created a new javadoc. Havin reviews and meetings as such is still a part of our work even though we don't have any more user stories to create.
